

CANNA

The solution for growth and bloom

Success Starts here

- ◆ **THE BEST START FOR SEEDLINGS AND CUTTINGS**
- ◆ **REDUCES THE RISK OF OVERFEEDING**
- ◆ **REDUCES THE RISK OF PLANT MATERIAL TURNING YELLOW**
- ◆ **COMPLETE 1-PART NUTRIENT**
- ◆ **LINKS UP PERFECTLY WITH CANNA VEGA NUTRIENTS**

CANNA Start

CANNA START

A unique nutrient designed to meet the needs of cuttings and seedlings.

With the addition of CANNA Start to the CANNA range, we offer a complete nutrient program for growing from Start to crop!

What is CANNA Start?

CANNA Start is a unique balanced one-part nutrient to meet the needs of seedlings and rooted cuttings. It can be used on various substrates like rockwool, coco, jiffy plugs, seedmixes, and most other propagation media. CANNA Start gives you all the primary, secondary and micro nutrients for a cutting or seedling to develop into a strong healthy plant. CANNA Start is a nutrient, (not an additive for root development) and can be combined perfectly with a root stimulator like CANNA RHIZOTONIC for a powerful tool in your growers toolbox.

Why CANNA Start?

CANNA Start is unique, not comparable to other products. Cuttings and seedlings have different needs than established plants. Therefore a normal nutrient for the vegetative stage is not suitable for cuttings and seedlings because you run the risk of overfeeding. Diluting a vegetative nutrient to make it more suitable for cuttings and seedlings isn't the answer either. Such a dilution doesn't contain enough micro and macro elements. This causes yellowing of the plant material; not a good start for your crop. To ultimately achieve strong, healthy plants at the end, you

have to start off right at the very beginning. That's why CANNA developed CANNA Start; to get the exact ratio of all nutritional elements for cuttings and seedlings right. After all, well begun is half done.

CANNA Start is perfect for growers that:

- Grow from seeds
- Take their own cuttings
- Put their cuttings in small pots first, before transplanting them into the final medium

How to use CANNA Start?

CANNA Start is a complete one-part nutrient meaning it contains all the needed elements in one bottle (no A and B versions needed). CANNA Start is mixed with water and applied through your nutrient reservoir or by hand watering. It can be used for the first week on transplanting new cuttings and two to three weeks on seedlings. It is suitable for use on all propagation media with the exception of re-circulating systems or cloning machines.

CANNA Start links up perfectly with all other CANNA nutrients. Once cuttings are transplanted from plugs into the final medium, you switch from CANNA Start to the CANNA Vega nutrient suitable for the medium you're growing on (TERRA, COCO, SUBSTRA or AQUA) for the remainder of the vegetative phase.

Growing from cutting to crop with CANNA!
